Ethics of Emergency Medicine

AN ANALYSIS OF DILEMMAS POSED BY PREHOSPITAL DNR ORDERS

☐ **Abstract—This article briefly recounts the development of the prehospital do-not-resuscitate (DNR) order and indicates certain situations, such as a choking episode or a suicide attempt, in which the presence of a DNR order may provoke a moral dilemma for the emergency medical technician as to whether or not the patient should be treated. An ethical analysis of this question is performed and concludes that resuscitative treatment is ethical and mandatory.** Copyright © 1997 Elsevier Science Inc.

☐ **Keywords—EMS DNR order; prehospital DNR; autonomy; resuscitation**

INTRODUCTION

There has been an increase in respect for autonomy within society. There is no need to recount the court decisions and changes in public attitudes that have caused increased recognition of an individual's right to refuse unwanted medical treatment (1). Almost no one questions the right of an individual to refuse life-saving or life-prolonging medical treatment. There has been a proliferation of documents, living wills, durable powers of attorney for health care, etc., that assist individuals in making their end-of-life decisions known. This essay will deal with a single example of this range of documents, the emergency medical service do-not-resuscitate (EMS DNR) order, and the ethical dilemmas it may pose in certain circumstances.[1]

The EMS DNR order was created to allow individuals to provide an advance directive to emergency medical technicians (EMTs) regarding their desire for or against resuscitative treatment (2), thus becoming one of the last areas of medicine to do so (3). The EMS DNR order, although an expression of individual wishes, is usually couched in the form of a physician order to ensure that EMTs will honor it.

The EMS DNR order is a document that attempts to remedy the shortcomings other advance directives present in prehospital decision making by providing a simple and rapid means of identifying those individuals who do not wish to be resuscitated. These orders have been implemented, by statute or regulation, in a number of states[2] and are pending in others.[3] The document

---

[1] Although limited to the context of EMS, the situations occur elsewhere in medicine, such as the DNR patient who chokes on a piece of food in the hospital.

[2] The list grows almost daily. Currently, there are at least 25 states with some type of prehospital regulation allowing DNR: Alaska, Arizona, Arkansas, California, Colorado, Florida, Georgia, Hawaii, Idaho, Illinois, Kansas, Kentucky, Maryland, New Mexico, New York, Pennsylvania, Rhode Island, South Carolina, Tennessee, Utah, Virginia, Washington, West Virginia, and Wyoming. (See also Adams JG. Prehospital do-not-resuscitate orders: a survey of state policies in the United States. Prehosp Disast Med. 1993;8:317–322).

[3] A consensus document to coordinate these efforts was created by a task force working under the auspices of the National Association of State EMS Directors (NASEMSD) and the National Association of Emergency Medical Services Physicians (NAEMSP) and released as the National Guidelines for Statewide Implementation of EMS "Do Not Resuscitate" (DNR) Programs (Prehosp Disast Med. 1994;9(2):67–69).
